Hands-on analysis of data demonstrates the interplay between statistics and computation. Includes four modules, each centered on a specific data set, and introduced by a domain expert. Provides instruction in specific, relevant analysis methods and corresponding algorithmic aspects. Potential modules may include medical data, gene regulation, social networks, finance data (time series), traffic, transportation, weather forecasting, policy, or industrial web applications. Projects address a large-scale data analysis question. Students taking graduate version complete additional assignments. Enrollment limited; priority to Statistics and Data Science minors, and to juniors and seniors.

Project-based seminar covers recent developments in energy
conversion and storage technologies. Merits of alternative
technologies are debated based on their environmental performance
and cost, and their potential improvement and scalability. Project
teams develop quantitative models and interactive visualization
tools to inform the future development of these technologies.
Models may probe how the impact of a technology depends on
assumptions about future advancements in materials or device
design. Other projects may develop models for rational design
choices (the selection of a particular material or processing
technique) based on economic and environmental performance and
physical constraints.
